Computerized Dry Kiln Control & Information at the Touch of a Button

Coe Moore's Series 22M is the smart, flexible approach to lumber drying with multi zone controls, advanced steam management, direct-fired burner control and user-defined PLC functions. The superior graphical interface makes it the first choice of operators because it is the system they already know how to use.

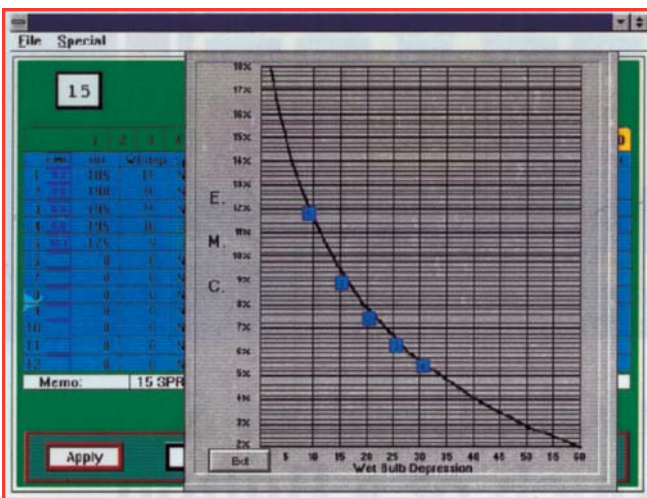

Real time Displays and Reporting that Keep You and Your Operators Informed and Confident

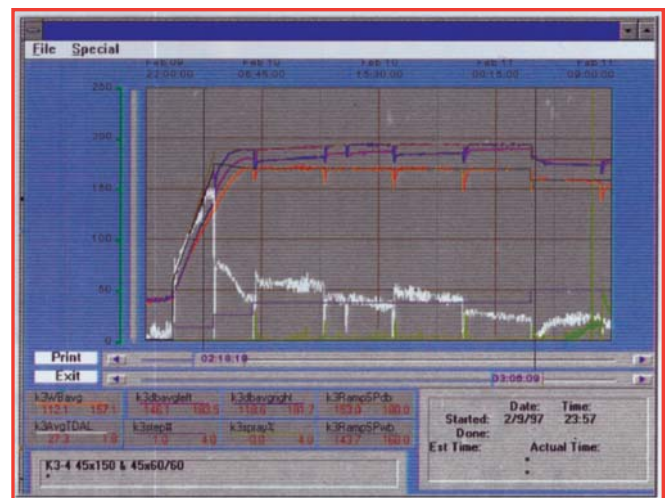

Schedule - The schedule allows traditional timed step control of the drying based on entering or exiting air, or automatic schedule advance based on TDAL or in-kiln moisture monitors.

Moisture by Board - The system tracks the moisture content of each board in the package from the kiln through the planer.

Schedule/EMC - As schedules are created or changed, the EMC for each step is displayed in a graphical form.

History Chart - Historical charts with up to eight screen pens display data for each charge. The screen also has memo fields for annotation. Each screen may be printed as a report.
